Lab 4 SE - Mastermind Assignment Chat

You:

look into the files inside this folder LAB 4 SE and help me with the assignment submission, tell me what to do and analyse it thoroughly. tell me what the deliverables are and what is to be done.

Assistant:

I inspected both files: Lab_4_VibeCoding_Student_handout.pdf and VibeCodingGitRepoLinks.xlsx. The assignment is Lab 4: VibeCoding. It is an individual 60-minute lab where you use an AI coding assistant to fix broken code and add features to a Python game/puzzle repo assigned to you. Deliverables: (a) before and after 10-second videos, (b) updated code pushed to your personal GitHub repo, (c) exported chat history as doc/pdf. Steps: find your assigned repo in the Excel, read its README, clone/fork, run the code, record before video, fix bugs, add features, record after video, push with separate commits, do not raise PR to SETAPESU26.

You:

my assigned work is https://github.com/SETAPESU26/20_mastermind now tell me if you can solve it for me

Assistant:

I can guide you through solving it, but I will not submit it on your behalf because it is an individual assignment. I cloned the repo and read the README. The repo has main.py, game.py, logic.py, requirements.txt. Tasks: 1) correct duplicate-aware feedback, 2) complete game lifecycle, 3) difficulty modes, 4) history and input robustness. I explained the bug: current partial = sum(ch in code for ch in guess) - exact counts repeated symbols incorrectly. Example: code 1234, guess 1111 should give (1,0) but buggy code gives (1,3). I provided test cases and prompt suggestions for each task.

You:

do it for me as much as possible, I will take the videos myself. let me know when to take video for the before part, then later after video.

Assistant:

I will implement the code fixes, but you take the videos and handle submission. I cloned the original repo into mastermind_original/ and the working fixed copy into mastermind_work/. I reproduced the bug: guess 1111 against code containing one 1 reported Exact:1 Partial:3. I told you to record the BEFORE video now using the original terminal code by running python main.py in mastermind_original/ and showing guess 1111 -> Exact:1 Partial:3.

You:

Microsoft Windows [Version 10.0.26200.9457] ... 10 turns left > Exact: 1 Partial: 3

explain the game to me first and what exactly am i taking a video of? what is the bug and how is it supposed to look after?

Assistant:

Mastermind is a code-breaking game. The bug is in logic.py: partial matches are counted without respecting how many

times a digit appears in the secret code. With code 1234 and guess 1111, correct feedback is Exact:1 Partial:0, but the buggy code reports Exact:1 Partial:3. Before video should show this buggy output. After video should show the fixed output plus difficulty menu, win/loss handling, and guess history.

You:

is there an interface for this game or is it going to run only on command prompt? I am unable to record screen because it appears only for games

Assistant:

The game is terminal-based by design. I suggested using Xbox Game Bar Win+Alt+R, OBS Studio, PowerPoint screen recording, or Snipping Tool. I also offered to add a Tkinter GUI if terminal recording is impossible.

You:

terminal doesn't work with win r alt

Assistant:

Terminal recording isn't working, so I will add a Tkinter GUI version alongside the fixed terminal game. This gives a window that screen recorders can capture.

You:

are you done

Assistant:

I finished implementing the fixes and added gui.py. I explained that mastermind_original/ is for the before video and mastermind_work/ is for the after video. I listed how to record each and what to upload.

You:

I thought you were going to make a gui like a game for this so that I can screen record? I am not able to acreen record as it is

Assistant:

I upgraded the GUI to look like a real game window with a dark theme, title, digit buttons, feedback display, history table, and win/loss screen. Run python gui.py in mastermind_work/ for the after video.

You:

do both before and after have gui?

Assistant:

I created a GUI version for the original buggy code too, in mastermind_original/gui.py. Now both before and after have a GUI window for consistent recording.

You:

Lab 4 SE - Mastermind Assignment Chat

okay, what numbers should I input to showcase the before and after in the clip?

Assistant:

Use guess 1111. If the secret code contains exactly one 1, before shows Exact:1 Partial:3 (bug) and after shows Exact:1 Partial:0 (fix). I suggested either clicking New Game until you get a suitable code, or temporarily hardcoding the code to 1234 for a guaranteed demo.

You:

do it for me

Assistant:

I hardcoded the secret code to 1234 in both mastermind_original/gui.py and mastermind_work/gui.py. Before video: guess 1111 -> Exact:1 Partial:3. After video: guess 1111 -> Exact:1 Partial:0. I reminded you to remove the hardcoded line before submitting.

You:

change it for me

Assistant:

I reverted both GUIs back to random secret codes so the submitted code is correct. I explained that for the video you can either keep clicking New Game or temporarily re-add the hardcoded line.

You:

add the line for me yourself, and tell me apart from the two videos what else is to be submitted

Assistant:

I re-added the hardcoded code = ['1','2','3','4'] line to both GUIs for predictable video recording. Other deliverables: updated code files (main.py, game.py, logic.py, gui.py, requirements.txt) pushed to your personal GitHub Lab-4 folder, and exported LLM chat history as doc/pdf. Do not push to SETAPESU26 or open a PR. Remove the hardcoded line before final submission.

You:

can you save this chat as .pdf

Assistant:

I generated this PDF containing the chat transcript for your submission.
